

COACHING REPORT

AUGUST 28, 2026

Speaker: Michael Geiser (mgeiser@mgeiser.net)
File: 1_Introducing AgentCore.mp3
Presentation: Prep for AWS User Group Presentation
Description: Describes the Agentcore architecture and components

Your presentation is competent with a solid foundation. Prioritizing improvements in audience engagement will yield the greatest score gains.

TALK TIMELINE Presentation duration: 5 min 06 sec

Effective starts at 6.5 ↑

MEASURED, NOT JUDGED

Speaking Rate	234 WPM	Target Range	130–170 WPM
Filler Words	2	"So" Openers	1
Pauses > 1s	1	Longest Run	177.8s
Close Share	15.0%	Enunciation	100%

You scored 6.1 out of 10, placing you in the Competent band. Your three highest-leverage improvements are: Confidence, Confidence, and Authority. Addressing these will create measurable progress toward the next performance band.

Executive Summary

Your presentation scores 6.1 out of 10, placing you in the Competent band — and that rating is both accurate and instructive. You are doing enough right to be credible and followable, but not enough to be genuinely compelling. The gap between where you are and where you could be is not a gap in knowledge or preparation; it is a gap in presence, precision, and persuasive discipline. You have the raw material of an excellent technical communicator, but recurring habits in language choice, pacing, and evidence are consistently capping your ceiling.

What you do well forms a coherent pattern: you are an authoritative, audience-aware communicator who understands your material at a deep level. Your Technical Communication score of 7.2 reflects that your prototype-to-production narrative is well-constructed and threaded consistently throughout, and your use of concrete contrasts — like the local SQL database example — genuinely grounds abstract infrastructure concepts for your audience. Your Delivery score of 6.8 shows that your diction is clear, your transitions are functional, and your approachable, conversational style lowers the barrier to complex cloud architecture content. Across Audience Engagement and Executive Presence, your consistent use of second-person language and audience-centric framing demonstrate real instinct for connecting with listeners. These strengths build a solid floor.

The two changes most likely to move your overall score are eliminating weakening language and introducing strategic pauses. On language, the word "cool" appears at least six times in your transcript, and informal qualifiers like "super, super easy," "fuss around with," and "nasty problem" appear throughout. In a developer tutorial these feel approachable, but they are actively eroding your Gravitas score within Executive Presence and flattening the persuasive weight of genuinely strong technical points. Every time you say "it's really cool," you are spending credibility you have already earned. On pausing, your Pacing dimension reveals inter-word gaps of only 0.3 to 0.5 seconds across almost the entire presentation. When you say "Big one is memory" or ask "How do I actually keep track of these conversations over time?", you follow those moments within half a second — and in doing so, you erase their impact. These are not style preferences; they are the precise mechanics by which authority is communicated.

Your weakest dimensions — Audience Engagement at 5.2 and Persuasion at 5.8 — are dragging down the overall score in ways that compound each other. Persuasion is suffering primarily because every benefit claim you make is unsupported: there is not a single statistic, benchmark, or customer example in the entire presentation. That absence directly

undermines engagement, because audiences disengage when assertions feel unanchored. Meanwhile, your Structure score of 6.2 reflects redundancy across sections, particularly around framework flexibility and deployment abstraction, which are revisited multiple times without signaling that the repetition is intentional. Fixing your evidence usage would simultaneously strengthen Persuasion, lift Audience Engagement through narrative depth, and tighten Structure by giving each section a distinct job to do.

For your next recording, your assignment is specific. In the first 30 seconds, replace any instance of "cool" or "super easy" with a precise claim — say "this removes three infrastructure decisions from your deployment process" rather than "it's really cool." Remove the word "cool" from your vocabulary entirely for this recording. After your opening hook, insert one real-world anchor: a number, a named company type, or a documented pain point with scale. Then, after the sentence "Big one is memory," pause for a full two seconds before continuing. That single pause, in that single moment, will do more for your perceived authority than any other change you can make in five minutes of audio.

Overall Coaching Assessment

You are solidly in competent territory across the board, and your two strongest dimensions — technical communication and delivery — reveal exactly where your foundation lies: you know this material deeply and you communicate it clearly. That authentic technical mastery is genuinely rare and must be protected as you develop. Do not let the pursuit of polish strip away the approachable, conversational energy that makes complex cloud architecture feel accessible. That quality is an asset, not a liability.

Your highest-return priority right now is building executive presence through language discipline. The habit of reaching for "cool," "pretty cool," and "if you ask me" is costing you credibility with every repetition — not because enthusiasm is wrong, but because your audience needs evidence, not endorsement. Pair this work with eliminating filler sounds and hedging phrases, replacing hesitation with deliberate silence. These two habits are connected: both signal a presenter who is still seeking approval rather than commanding the room. Record yourself, flag every instance, and practice substituting concrete proof points and confident pauses instead.

The secondary priority is structural tightening — a stated agenda at the outset and consolidated coverage of overlapping themes will reward an audience that is already largely on your side. At this stage of your development arc, fixing language discipline will unlock a full band jump in perceived credibility, while structural refinements will make what is already working feel intentional rather than fortunate. Focus there first.

Your Three Moves

Your three highest-leverage improvements are interconnected. Addressing Confidence will create a foundation for the other changes. Working on Confidence reinforces that foundation and amplifies your impact. Finally, improving Authority ties everything together, helping you deliver a more cohesive and compelling presentation.

+4.8 Confidence

Replace casual openers with a strong, declarative hook. Eliminate filler phrases such as 'sort of,' 'kind of,' and 'you know.' Open with a bold value proposition: 'Amazon Bedrock Agent Core solves the #1 barrier to enterprise AI adoption: getting agents from prototype to production at scale.' The presentation opens with casual, informal language ('Hey everyone') and relies heavily on filler words and hedging phrases throughout. Notable examples include 'sort of a visceral feeling,' 'it's kind of a mishmash of stuff,' 'you know,' 'kind of unusual,' and 'pretty cool if you ask me.' These undermine the authoritative delivery expected of an executive-level communicator.

Lifts: Delivery

+4.8 Confidence

Audit your script for the word 'actually' and remove it in all instances where it does not add factual distinction. Replace constructions like 'you can actually take that idea to production' with the more direct and authoritative 'you take that idea directly to production.' The repeated use of 'actually' (appearing approximately 8 times in the transcript) is a common linguistic marker of low-confidence speech, often used when a speaker is preemptively defending a claim they expect to be doubted. Examples include 'you can actually take that idea,' 'actually managing the containers,' 'actually keep track,' and 'actually reference back.'

Lifts: Delivery

+4.8 Authority

Leverage this technical depth more strategically by anchoring key points with specific outcomes or metrics. For example, instead of saying a feature is 'cool,' quantify its business impact: 'This reduces deployment time from weeks to hours.' The speaker demonstrates genuine technical command of the subject matter, accurately explaining serverless deployment, MCP server abstraction via gateways, short-term versus long-term memory architecture, and CloudWatch observability integration. Technical terminology (Docker, ECR, ECS, SDK frameworks, MCP) is deployed fluently and correctly, establishing domain credibility.

Lifts: Delivery

Do not lose these while you fix the rest

- Strong and consistent value proposition framing: the 'prototype to production' narrative is established immediately and threaded throughout, giving listeners a clear mental model of why Agent Core exists and who.
- Effective use of concrete contrasts to illustrate scale limitations, particularly the local SQL database example for memory, which grounds an abstract distributed systems problem in familiar developer experience.
- Appropriate hedging of time-sensitive technical claims ('as of the time of this recording') demonstrates intellectual honesty and prevents the content from aging poorly.
- The presenter successfully communicates the framework-agnostic nature of Agent Core — a genuinely non-obvious characteristic for an AWS product — with appropriate emphasis and multiple examples (OpenAI, LangGraph, LangChain, CrewAI).

Projected impact scores are estimates derived from rubric weightings and do not guarantee exact score increases.

5.2

/10

Competent

Audience Engagement

Your audience engagement is competent but has 1 high-priority area to strengthen.

Weakest dimension · 1 high-severity finding

What is working

- Consistent use of second-person ('you') throughout the presentation creates a personal, direct conversational tone that makes the audience feel individually addressed and keeps the content relevant to their context.
- The presenter effectively frames technical features as solutions to real developer pain points (e.g., scale challenges, memory persistence, authentication complexity), which grounds abstract concepts in practical relevance.
- Inclusive 'we' language ('let's get started,' 'we're going to use throughout this course') builds a sense of shared journey and collaborative learning between presenter and audience.

HIGH Q&A Handling

There is no Q&A segment present in the transcript. This appears to be an introductory recorded lecture segment, so live Q&A may occur later. However, the presenter does not set up any anticipatory Q&A invitation, nor does he acknowledge potential audience questions inline (e.g., 'You might be wondering at this point...').

Try: Even in recorded formats, preemptively address likely audience questions: 'You might be asking — what if I'm already using LangChain and don't want to change anything? Great news — you don't have to.' End the segment with a clear Q&A invitation: 'Post your questions in the discussion forum and I'll answer them there.' This dramatically increases perceived engagement.

Effort: moderate · Impact: high

MEDIUM Storytelling

The presenter frames the technology around a relatable problem-solution narrative ('take your agentic AI prototypes and turn them into production-level solutions'), which is effective. However, there are no concrete anecdotes, real-world case studies, or customer stories. Phrases like 'nasty problem' and 'that's not gonna cut it at scale' show personality but lack narrative depth.

Try: Introduce a brief story such as 'Imagine you've built a great AI agent demo for your company and your boss loves it — but when you try to scale it, everything breaks. That's exactly the situation Agent Core was designed to solve.' A narrative arc with characters and stakes would dramatically increase emotional engagement.

Effort: moderate · Impact: medium

MEDIUM Eye Contact References

As a recorded/online presentation, direct eye contact cues are inherently limited. The presenter uses inclusive language ('we're going to use throughout this course,' 'let's get started,' 'let's look at the capabilities') that simulates shared experience. However, there are no explicit cues that suggest direct visual engagement such as pausing to scan the room or acknowledging specific audience segments.

Try: For video/recorded presentations, use language that simulates direct address: 'Look at this diagram with me for a moment' or 'If you're watching this and you're a LangChain user, pay close attention here.' Also consider camera-direct moments where you speak directly into the lens to simulate eye contact.

Effort: moderate · Impact: medium

MEDIUM Attention-Holding Strategies

The presenter uses casual, relatable language ('super, super easy,' 'nitty gritty,' 'mishmash of stuff,' 'fuss around with Docker') which lowers cognitive barriers and maintains an approachable tone. The phrase 'It's really cool' and 'that's pretty cool if you ask me' conveys enthusiasm. However, there are no explicit surprises, humor, analogies, demonstrations of contrast, or varied pacing techniques detected in the transcript.

Try: Introduce a surprising or counterintuitive hook early on: 'You might expect Amazon to lock you into their ecosystem — but surprisingly, Agent Core works with ANY framework, including OpenAI's.' Also consider using brief pauses after key points, numbered lists verbalized aloud, or callback references to earlier content to maintain structural attention.

Effort: moderate · Impact: medium

LOW Rhetorical Questions

The presenter uses a few rhetorical questions effectively, such as 'What is Agent Core?', 'How do I actually keep track of these conversations over time?', 'How do I have a conversation with a user that can actually reference back to earlier conversations?', and 'at scale that becomes a problem, right?' These create mental engagement and signal transitions.

Try: Increase the frequency and variety of rhetorical questions throughout the presentation. For example, before introducing each feature: 'Ever struggled with managing authentication across multiple downstream services? Here's how Agent Core handles that.' This sustains curiosity and frames each feature as a solution.

Effort: moderate · Impact: low

Practice Drill 5 min

Practice drill for Audience Engagement: Record yourself for the allotted time focusing on 'Storytelling'. Introduce a brief story such as 'Imagine you've built a great AI agent demo for your company and your boss loves it — but when you try to scale it, everything breaks. That's exactly the situation Agent Core was designed to solve.' A narrative arc with characters and stakes would dramatically increase emotional engagement. Play back the recording and note improvements.

5.2

/10

Competent

Executive Presence

Your executive presence is competent but has 2 high-priority areas to strengthen.

Rank 2 of 7 · 2 high-severity findings

What is working

- Deep and authentic technical mastery: The speaker demonstrates clear, accurate, and comprehensive knowledge of Amazon Bedrock Agent Core's architecture, including containerization abstraction, serverless deployment, gateway patterns, memory management, identity federation, and CloudWatch observability integration. This domain authority is the strongest foundation for executive presence.
- Clear structural organization and logical flow: The presentation follows a coherent progression from value proposition to capability overview to hands-on demonstration, with consistent use of signposting phrases ('So at a high level,' 'Big one is memory,' 'Let's get started') that help the audience track the narrative and anticipate what comes next.
- Audience-centric framing: The speaker consistently frames capabilities in terms of direct audience benefit using second-person language ('you don't have to,' 'it will do that for you,' 'it gives you that flexibility'), demonstrating an understanding of the listener's perspective and needs rather than simply cataloguing product features.

HIGH Gravitas

Key strategic points are repeatedly diluted by informal qualifiers. Phrases like 'It's really cool,' 'that's pretty cool,' 'cool starter toolkit,' and 'super, super easy' appear multiple times, reducing the weight of substantive technical insights. The word 'cool' appears at least six times across the transcript, significantly eroding the gravitas of the delivery.

Try: Substitute enthusiasm-driven filler language with precise, outcome-oriented language. Instead of 'It's really cool,' say 'This is a significant shift because it eliminates the most common failure point in enterprise AI deployment.' Reserve emotional language for deliberate emphasis, not as a default descriptor.

Effort: moderate · Impact: high

HIGH Credibility Signals

The presentation is notably absent of quantitative data, customer evidence, comparative benchmarks, or case studies that would bolster credibility beyond personal opinion. Statements like 'I will say that,' 'I'm sure there'll be more,' and 'if you ask me' place the credibility burden entirely on the speaker's personal opinion rather than on evidence. The caveat 'as of the time of this recording, there's only a couple' also signals incomplete information being presented as a feature overview.

Try: Anchor claims with data: adoption metrics, deployment time reductions, cost comparisons, or customer outcomes. Replace opinion-based endorsements ('pretty cool if you ask me') with verified value statements. Acknowledge product limitations directly and briefly rather than as an afterthought, then pivot immediately to the roadmap or compensating strengths.

Effort: moderate · Impact: high

MEDIUM Gravitas

The speaker uses informal colloquialisms that are inconsistent with executive presence: 'fuss around with,' 'nitty gritty,' 'nasty problem,' 'cut it at scale,' 'dream up,' and 'mishmash of stuff.' While these may resonate in a developer community tutorial, they significantly reduce perceived seniority and strategic gravitas in a leadership or enterprise context.

Try: Replace colloquialisms with precise, professional language. 'Fuss around with Docker' becomes 'manage container infrastructure.' 'Nasty problem' becomes 'a critical operational challenge.' 'Mishmash of stuff' becomes 'an integrated set of capabilities.' Precision signals mastery; informality signals familiarity, not authority.

Effort: moderate · Impact: medium

MEDIUM Leadership Demeanor

The speaker positions themselves as a helpful guide ('we're going to,' 'let's get started,' 'we'll see how that works') rather than a strategic authority directing organizational transformation. The tone is instructional and tutorial-like, appropriate for an educational course setting but insufficient for projecting executive leadership presence in a boardroom or strategic briefing context.

Try: Shift from tutorial language to vision-casting language. Reframe instructional phrases with strategic framing: 'I'll demonstrate precisely how this capability eliminates your infrastructure bottleneck' rather than 'we'll see how that works shortly.' Establish clear stakes and outcomes before diving into mechanics.

Effort: moderate · Impact: medium

LOW Composure

Two audible filler sounds ('uh') were transcribed mid-sentence, both occurring during substantive points about built-in memory tools and agent SDKs. While infrequent, they signal momentary hesitation in an otherwise fluent delivery. The overall pacing appears steady with no signs of significant composure breakdown.

Try: Practice pause-and-breathe techniques as a replacement for 'uh' fillers. A deliberate one-second pause before a key term carries more authority than an audible hesitation and actually draws listener attention to the forthcoming point.

Effort: moderate · Impact: low

Practice Drill 5 min

Practice drill for Executive Presence: Record yourself for the allotted time focusing on 'Gravitas'. Substitute enthusiasm-driven filler language with precise, outcome-oriented language. Instead of 'It's really cool,' say 'This is a significant shift because it eliminates the most common failure point in enterprise AI deployment.' Reserve emotional language for deliberate emphasis, not as a default descriptor. Play back the recording and note improvements.

5.8

/10

Competent

Persuasion

Your persuasion is competent but has 2 high-priority areas to strengthen.

Rank 3 of 7 · 2 high-severity findings

What is working

- Clear and relatable identification of real developer pain points (container management, authentication, memory at scale) that directly motivate the product's value proposition, making the core argument relevant to the target audience.
- Effective emphasis on framework flexibility — repeatedly and convincingly communicating that Agent Core is not locked into AWS-native solutions (OpenAI SDK, LangGraph, LangChain, Crew AI are all mentioned) — which is a genuinely differentiating and persuasive point for a developer audience.
- The structured transition from prototype to production framing provides a logical narrative thread that ties the entire presentation together and gives the audience a clear mental model of where Agent Core fits in their workflow.

HIGH Evidence Usage

There is a complete absence of supporting data, statistics, benchmarks, customer case studies, or third-party validation throughout the entire presentation. Every benefit claim (ease of use, scalability, business value) is stated without evidence. The single concrete technical example offered — that prototype SDKs save memory to a 'local SQL database' — is illustrative but anecdotal.

Try: Incorporate at least 2–3 pieces of supporting evidence: a deployment time comparison (e.g., 'what took 2 weeks of DevOps work now takes 30 minutes'), a reference to an early adopter or beta customer result, or benchmark data on scaling performance. Even referencing AWS documentation or published blog posts would add credibility.

Effort: moderate · Impact: high

HIGH Credibility

Frank Kane introduces himself by name but provides no credentials, background, or reason the audience should trust his assessment of Agent Core. The presentation acknowledges uncertainty ('I'm sure there'll be more as time goes on', 'as of the time of this recording') and describes the product informally ('kind of a mishmash'). While this casual tone builds approachability, it undermines technical authority and trust in the product.

Try: Open with a brief credibility statement: mention your experience with AWS, AI development, or prior courses. When acknowledging limitations (only two built-in tools currently), frame it as informed transparency rather than uncertainty. Replace 'kind of a mishmash' with a more authoritative framing like 'a comprehensive platform that unifies deployment, tooling, and observability.' Reference offici

Effort: moderate · Impact: high

MEDIUM Call-to-Action Clarity

The presenter provides a transitional call-to-action at the end — building an OpenAI Agents SDK example and then deploying it with Agent Core — which gives the audience a clear next step within the course context. However, there is no broader call-to-action for viewers to adopt Agent Core in their own work, no urgency created, and no guidance on where to start outside of this specific course.

Try: Add a closing call-to-action that prompts the audience to take a specific action beyond the course: 'Sign up for an AWS free tier account and try deploying your first agent today using the starter toolkit' or 'Visit the Agent Core documentation and identify one prototype you could deploy this week.' Tie the CTA to the business value argument made earlier.

Effort: moderate · Impact: medium

MEDIUM Emotional Appeal

The presenter uses some mild emotional language ('visceral feeling', 'it's really cool', 'pretty cool if you ask me', 'nasty problem') that creates an informal, approachable tone. The pain points described — dealing with Docker, ECR, ECS, managing containers, scaling memory — resonate with developer frustrations. However, the emotional register remains low and flat throughout, missing opportunities to create excitement, relief, or urgency.

Try: Amplify emotional resonance by painting a vivid scenario: describe the frustration of having a brilliant AI prototype that dies in production due to infrastructure complexity, then position Agent Core as the solution that removes that barrier. Use a narrative arc — problem, struggle, resolution — to emotionally engage the audience before diving into features.

Effort: moderate · Impact: medium

MEDIUM Logical Structure

The presentation follows a reasonable sequence: introduction of the product → what it is → key capabilities → demonstration setup. However, the structure feels meandering with frequent digressions ('it's kind of a mishmash of stuff'), repetition of 'you don't have to' across multiple paragraphs, and lack of clear signposting between sections. The audience may lose track of the overall argument.

Try: Use explicit structural signposting: 'There are three core reasons you should consider Agent Core: [1] flexibility, [2] simplicity, [3] extensibility.' Number the capabilities when listing them. Begin with a clear problem statement, then present Agent Core as the solution, then enumerate its components systematically before transitioning to the demo.

Effort: moderate · Impact: medium

Practice Drill 5 min

Practice drill for Persuasion: Record yourself for the allotted time focusing on 'Evidence Usage'. Incorporate at least 2-3 pieces of supporting evidence: a deployment time comparison (e.g., 'what took 2 weeks of DevOps work now takes 30 minutes'), a reference to an early adopter or beta customer result, or benchmark data on scaling performance. Even referencing AWS documentation or published blog posts would add credibility. Play back the recording and note improvements.

6.2

/10

Competent

Pacing

Your pacing is competent but has 2 high-priority areas to strengthen.

Rank 4 of 7 · 2 high-severity findings

What is working

- The presenter maintains an engaging, conversational and enthusiastic tone throughout, with natural use of colloquial phrases ('super, super easy', 'nasty problem', 'nitty gritty') that keep the presentation accessible and relatable for a technical audience.
- The presentation follows a logical narrative arc — moving from 'what is the problem' to 'what is the solution' to 'what are the capabilities' to 'let's get started' — providing a clear structural backbone that helps orient the listener despite the rapid pace.
- Effective use of repetition and reinforcement for key concepts (e.g., 'at scale' is mentioned multiple times, reinforcing the production-readiness theme), which aids retention even at a fast delivery pace.

HIGH Appropriate Pauses

Strategic pauses are largely absent. The longest detectable inter-word gaps are around 0.3-0.5 seconds (e.g., $\sim t=192s$ between 'identity' and 'component', $\sim t=223s$ after 'actually'). The rhetorical question 'How do I actually keep track of these conversations over time?' ($\sim t=223s$) is immediately followed by another question with no pause, diminishing the effect. Similarly, the punchy statement 'Big one is memory.' ($\sim t=220s$) is followed within $\sim 0.5s$ by continuation, losing its potential dramatic im

Try: After rhetorical questions, pause for 1.5-2 seconds to let the question land before answering. After punchy declarative statements like 'Big one is memory,' pause for 1-2 seconds to let it resonate. Use silence as a structural tool, especially before transitioning to a new feature area.

Effort: moderate · Impact: high

HIGH Content Density

Multiple features are introduced in rapid succession within single audio segments. Segment 6 ($\sim t=119-149s$) covers the starter toolkit, container management abstraction, testing shortcuts, and extensibility tools all within ~ 30 seconds. Segment 7 ($\sim t=149-179s$) covers wrapping, extension, code interpreter, browser control, memory, identity, deployment, and toolbox concepts in ~ 30 seconds. This leaves little time for audience absorption of each concept.

Try: Group related concepts into distinct mini-sections with a brief pause and verbal signpost between each (e.g., 'Now, let's talk about the built-in tools...'). Consider breaking the capabilities list into chunked delivery — introduce one or two features, pause, then continue — rather than listing all features in a continuous stream.

Effort: moderate · Impact: high

MEDIUM Speed Variation

Analysis of word timing data reveals a consistently rapid delivery averaging approximately 155–165 words per minute across most segments, with little variation. Technical terms such as 'Docker', 'ECR', 'ECS', 'MCP server', 'CloudWatch', 'LangChain', and 'Crew AI' are spoken at the same pace as surrounding filler content, reducing their emphasis. Enthusiastic phrases like 'super, super easy' (~t=27s) and 'Big one is memory' (~t=220s) show slight natural slowing but not enough to meaningfully diff

Try: Deliberately slow down when introducing key product components (identity, memory, gateways, observability) and named technologies. Consider pausing briefly before and after introducing a key term for the first time, allowing it to register with the audience.

Effort: moderate · Impact: medium

MEDIUM Segment Balance

The presentation can be divided into: Introduction (~0–35s, ~11%), Core Features Overview (~35–179s, ~47%), Detailed Capabilities Walkthrough (~179–294s, ~37%), and Call to Action/Next Steps (~294–307s, ~4%). The conclusion/call-to-action section is very compressed at roughly 13 seconds, giving the presentation an abrupt ending. The features overview section (~47%) is disproportionately long given it repeats many concepts later elaborated in the detailed walkthrough.

Try: Expand the closing/next-steps section to at least 30–45 seconds to give a proper sense of closure. Consider trimming some repetition in the first features overview to allow more time at the end, or clearly distinguish 'high-level intro' from 'detailed walkthrough' with a more prominent verbal signpost.

Effort: moderate · Impact: medium

LOW Speed Variation

Two filler sounds ('uh') are detected at approximately t=159s and t=240s, both occurring mid-sentence during technical explanations. These disrupt flow slightly and suggest momentary loss of verbal momentum during technically dense content.

Try: Replace filler 'uh' sounds with a brief intentional pause. Practicing the delivery of technically dense sections (memory, identity, gateways) will reduce hesitation and replace fillers with purposeful silence.

Effort: moderate · Impact: low

Practice Drill 5 min

Practice drill for Pacing: Record yourself for the allotted time focusing on 'Speed Variation'. Deliberately slow down when introducing key product components (identity, memory, gateways, observability) and named technologies. Consider pausing briefly before and after introducing a key term for the first time, allowing it to register with the audience. Play back the recording and note improvements.

6.2

/10

Competent

Structure

Your structure is competent but has 1 high-priority area to strengthen.

Rank 5 of 7 · 1 high-severity finding

What is working

- Strong, engaging opening that immediately establishes who is speaking, what the tool is, and why it matters to the audience — the prototype-to-production framing is a compelling hook.
- Forward-looking signposts ('we'll see how that works in a moment,' 'we'll talk about there') effectively build anticipation and signal that the content is part of a larger structured course.
- The logical arc from concept to capabilities to hands-on demo follows a sensible learning progression appropriate for a technical tutorial audience.

HIGH

Conclusion Impact

The presentation ends with a practical forward-looking statement ('I'm going to start by building an OpenAI Agents SDK example here, and we're just going to start with a standalone agent... Right after that, we're going to go ahead and deploy that using Agent Core and see how easy that is to do'). While this sets up the hands-on activity well, there is no synthesizing summary of what was just covered, no memorable closing statement, and no call to reflect on the significance of Agent Core for th

Try: Before launching into the demo, add a 2-3 sentence summary that reinforces the core message: 'So to recap — Agent Core lets you take any agent framework, wrap it in a production-ready serverless environment, and extend it with built-in memory, identity, gateways, and observability — all without managing infrastructure. Now let's see exactly how simple this is.' This bridges the conceptual and prac

Effort: moderate · Impact: high

MEDIUM

Logical Flow

The presentation broadly follows a logical arc: problem framing (prototype-to-production gap) → what Agent Core is → framework flexibility → starter toolkit → capability deep-dive → 'let's get started' call to action. However, there is notable redundancy: framework flexibility and the starter toolkit are introduced early (first ~120 seconds), then re-explained again during the capabilities walkthrough, causing the audience to lose track of where they are in the narrative.

Try: Consolidate related content into a single pass. Introduce framework flexibility once, then move directly into capabilities. Avoid circling back to already-covered topics without an explicit acknowledgment (e.g., 'Now let's go deeper into the toolkit we briefly mentioned').

Effort: moderate · Impact: medium

MEDIUM Organization

The presentation can be segmented into roughly four sections: (1) hook and value proposition, (2) 'What is Agent Core?' — deployment/serverless overview, (3) framework flexibility and starter toolkit, (4) capability catalogue (identity, authentication, built-in tools, memory, gateways, runtime, observability). However, sections 2 and 3 overlap significantly, and the capabilities section (4) partially repeats content already mentioned in sections 2-3 (e.g., built-in tools, deployment abstraction)

Try: Divide the talk into explicitly labeled sections with verbal headings such as 'First, let me explain what Agent Core does at a high level,' 'Second, let's look at its key capabilities in detail,' and 'Finally, let's get hands-on.' This prevents content drift and repetition.

Effort: moderate · Impact: medium

MEDIUM Transitions

The most common transition word throughout the presentation is 'So,' used repeatedly (over 20 times) as a connector between nearly every idea. Phrases like 'The other cool thing,' 'Big one is memory,' and 'And then' are used, but these are informal and do not clearly signal a shift in topic. The move from the conceptual capabilities overview to the hands-on demo ('So let's get started') is abrupt — there is no summary or bridge connecting the two halves.

Try: Replace repetitive 'So' transitions with purposeful signposting: 'Now that we've covered deployment, let's turn to the extended capabilities,' or 'With that foundation in place, let me walk you through the architecture diagram.' Before the demo, add a brief transition like 'Now that you understand the full picture of Agent Core, let's see it in action.'

Effort: moderate · Impact: medium

MEDIUM Signposting

The presenter uses some forward-pointing signposts ('we'll see how that works in a moment,' 'we'll see that shortly,' 'we'll talk about there') which help maintain anticipation. However, there are no backward-looking signposts to anchor earlier points, and there is no explicit enumeration of the capabilities (e.g., 'The first capability is... the second is...'). The section 'at a high level, let's look at the capabilities' is the closest thing to a structural marker, but it arrives late (~3 min)

Try: Add numbered or named signposts when cataloguing capabilities: 'Agent Core has six key components. Let me walk through each one: number one, identity management...' This helps the audience track progress and retain information.

Effort: moderate · Impact: medium

Practice Drill 5 min

Practice drill for Structure: Record yourself for the allotted time focusing on 'Logical Flow'. Consolidate related content into a single pass. Introduce framework flexibility once, then move directly into capabilities. Avoid circling back to already-covered topics without an explicit acknowledgment (e.g., 'Now let's go deeper into the toolkit we briefly mentioned'). Play back the recording and note improvements.

6.8

/10

Effective

Delivery

Your delivery is effective with minor refinements possible.

Rank 6 of 7 · 0 high-severity findings

What is working

- Strong articulation and clear diction throughout — technical terminology including AWS service names, SDK names, and cloud architecture terms are delivered with high clarity and confidence, as evidenced by near-perfect transcription confidence scores.
- Conversational and approachable delivery style that makes complex cloud infrastructure topics accessible, using relatable language like 'fuss around with Docker,' 'nitty gritty,' and 'dream up' to lower the cognitive barrier for learners.
- Good use of signposting and structural transitions ('So let's get started,' 'Right after that,' 'So at a high level') that help the audience follow the logical flow of the presentation.

MEDIUM Pace

The presentation runs approximately 307 seconds (~5 minutes) and covers a dense amount of technical content. Word-timing analysis shows a relatively consistent and brisk pace averaging around 150-160 words per minute with minimal variation. While mostly appropriate, some complex sections (e.g., listing multiple frameworks: 'OpenAI Agents SDK, LangGraph, LangChain, Crew AI') are delivered without sufficient pacing adjustment to let details sink in.

Try: Slow down deliberately when introducing lists of technical terms or new concepts. Vary pace more intentionally — speed up for transitional phrases and slow down for key value propositions to guide listener attention.

Effort: moderate · Impact: medium

MEDIUM Pauses

There is a notable pause of approximately 1.4 seconds after 'Amazon Technologies' (~178s) before resuming with 'So, at a high level,' suggesting some natural strategic pausing. However, pauses are generally brief (0.3-0.5 seconds) and not consistently used to emphasize key points like 'Big one is memory' or 'That's what this is all about.'

Try: Insert deliberate 2-3 second pauses after major topic transitions and before high-impact statements. For example, pause after 'Big one is memory.' to allow the weight of the point to land before continuing the explanation.

Effort: moderate · Impact: medium

MEDIUM Vocal Variety

The transcript reveals a conversational and relatively consistent tone, but lacks notable tonal shifts to distinguish between introductory context, key feature highlights, and call-to-action moments. Phrases like 'It's really cool' and 'that's pretty cool if you ask me' suggest enthusiasm but may rely on word choice rather than vocal inflection to carry energy.

Try: Use pitch variation more deliberately — raise pitch and energy when introducing exciting features (e.g., framework flexibility, memory capabilities) and lower pitch for authoritative statements. Consider recording practice runs to audit your tonal range.

Effort: moderate · Impact: medium

LOW Energy

The presenter demonstrates genuine enthusiasm, particularly in the opening ('It's really cool'), when emphasizing flexibility ('You can wrap anything you can dream up'), and when signaling transitions ('So let's get started'). Energy level is consistently positive and engaged throughout, though it remains at a somewhat uniform level without notable peaks.

Try: Introduce deliberate energy peaks at 2-3 key moments — for example, when revealing the framework-agnostic nature of Agent Core or the practical starter toolkit — to create memorable highlights that punctuate the listener's experience.

Effort: moderate · Impact: low

LOW Projection

The high confidence scores from the transcription engine (majority of words at 0.95-1.0 confidence) indicate strong articulation and clear pronunciation throughout. Technical terms like 'Amazon Bedrock,' 'ECR,' 'ECS,' 'MCP server,' and 'CloudWatch' are all captured with high accuracy, suggesting clear projection and diction.

Try: Maintain current projection quality. Consider slightly varying volume for emphasis — speaking slightly louder on key terms like 'serverless,' 'production-level,' and 'any agent framework' to reinforce their importance to the listener.

Effort: moderate · Impact: low

Practice Drill 10 min

Practice drill for Delivery: Record yourself for the allotted time focusing on 'Pace'. Slow down deliberately when introducing lists of technical terms or new concepts. Vary pace more intentionally — speed up for transitional phrases and slow down for key value propositions to guide listener attention. Play back the recording and note improvements.

7.2

/10

Effective

Technical Communication

Your technical communication is effective with minor refinements possible.

Rank 7 of 7 · 2 high-severity findings

What is working

- Strong and consistent value proposition framing: the 'prototype to production' narrative is established immediately and threaded throughout, giving listeners a clear mental model of why Agent Core exists and who it is for.
- Effective use of concrete contrasts to illustrate scale limitations, particularly the local SQL database example for memory, which grounds an abstract distributed systems problem in familiar developer experience.
- Appropriate hedging of time-sensitive technical claims ('as of the time of this recording') demonstrates intellectual honesty and prevents the content from aging poorly.

HIGH Appropriate Jargon Usage

Several technical terms are introduced without definition: 'MCP server' (Model Context Protocol) is used multiple times as a known concept without explanation; 'ECR' and 'ECS' are listed but never expanded; 'observability' is mentioned without clarifying what it means in this operational context. By contrast, 'serverless' is used correctly and in context, and 'Docker' is broadly understood enough to omit a definition.

Try: Add a brief parenthetical or one-sentence explanation when first introducing MCP (e.g., 'MCP server — a standardized interface for tools'), ECR (Elastic Container Registry), and ECS (Elastic Container Service). This prevents knowledge gaps for less experienced listeners.

Effort: moderate · Impact: high

HIGH Visual Aid Effectiveness

The presenter makes multiple forward references to visual content ('let's look at the capabilities,' 'we'll see that in a moment,' 'we'll see how that works shortly'), strongly implying an accompanying diagram or slide. However, no description of what is visually shown is provided in the transcript, meaning the spoken content alone does not convey the architectural diagram being referenced. Listeners relying solely on audio would lose significant context.

Try: Verbally narrate the visual content explicitly as it is displayed. For example: 'On this slide, you can see a central agent box surrounded by five components — identity, authentication, built-in tools, memory, and gateways.' This ensures the audio track is independently comprehensible and reinforces the visual for all learners.

Effort: moderate · Impact: high

MEDIUM Complexity Management

The presentation does attempt a layered structure: introduction → overview of Agent Core → deployment abstraction → framework flexibility → starter toolkit → individual capability deep-dives. However, the sequencing has redundancy issues. Memory is mentioned as a capability in the general list, then mentioned again in 'big one is memory' section, and framework flexibility is revisited multiple times. The repetition, while sometimes reinforcing, occasionally feels unstructured rather than intentional.

Try: Adopt a more explicit signposting structure. Use clear transition phrases like 'Now that we've covered what Agent Core is, let me walk through each of its five capabilities in order.' This helps listeners track where they are in the explanation hierarchy and reduces the feeling of a loosely organized 'mishmash' (the presenter's own word).

Effort: moderate · Impact: medium

MEDIUM Analogy and Metaphor

The presenter uses several effective informal analogies: 'containers under the hood' evokes automotive abstraction; 'wrap anything you can dream up' communicates the universality of the wrapping mechanism; 'toolbox' is an apt metaphor for the optional capability extensions; 'middle layer' for gateways accurately conveys the architectural role. The local SQL database contrast for memory is a strong concrete anchor. However, no analogy is offered for the more abstract concept of 'identity management'.

Try: For agent identity management, add a brief analogy such as: 'Think of it like a corporate badge — the agent has credentials that determine what systems it's allowed to access and on whose behalf it acts.' This would significantly clarify an otherwise abstract concept.

Effort: moderate · Impact: medium

LOW Technical Accuracy

The technical claims are generally accurate: the description of Agent Core's framework-agnostic nature, the serverless deployment model, the AWS Strands SDK relationship, and CloudWatch integration are all consistent with known AWS Bedrock Agent Core capabilities at time of recording. The presenter correctly hedges time-sensitive claims ('as of the time of this recording, there's only a couple [built-in tools]'). One minor imprecision: the presenter says 'gateways can make those look like an MCP'.

Try: When describing gateways, add a brief clarifying sentence: 'Specifically, gateways translate the REST or other APIs of external services into the MCP protocol that your agent natively understands, so you don't have to write custom integration code.' This precision helps technically sophisticated listeners and avoids potential misunderstanding.

Effort: moderate · Impact: low

Practice Drill 5 min

Practice drill for Technical Communication: Record yourself for the allotted time focusing on 'Appropriate Jargon Usage'. Add a brief parenthetical or one-sentence explanation when first introducing MCP (e.g., 'MCP server — a standardized interface for tools'), ECR (Elastic Container Registry), and ECS (Elastic Container Service). This prevents knowledge gaps for less experienced listeners. Play back the recording and note improvements.

Progress

⚠ Trend analysis is not yet implemented. This page will show your score history once three submissions are available.

This is your first submission. Trends need three data points before they mean anything.

PREVIEW: WHAT YOUR PROGRESS PAGE WILL SHOW

After three submissions, you'll see your overall score trend, per-dimension deltas, and which coaching moves produced measurable improvement.

How This Was Scored

Score Bands

8.5–10.0	Exceptional	People quote it afterward and then act on it.
6.5–8.5	Effective	Lands with the room and holds attention throughout.
4.0–6.5	Competent	Clear and correct. Not yet memorable or persuasive.
0.0–4.0	Developing	Content or delivery is getting in the audience's way.

Methodology

This report is produced by an automated evaluation system consisting of seven specialist agents, each independently scoring one dimension of your presentation against a detailed rubric. A supervisor agent then merges their outputs, collapses duplicate observations into single findings, and ranks everything by projected impact.

Measured metrics (speaking rate, filler words, pauses, etc.) are computed directly from the transcript and word-level timings. They are reproducible — running the same audio through the system again will produce identical numbers.

Model judgment (dimension scores, findings, suggestions) involves language model reasoning and may vary slightly between evaluation runs on the same content.
